FIG.-39

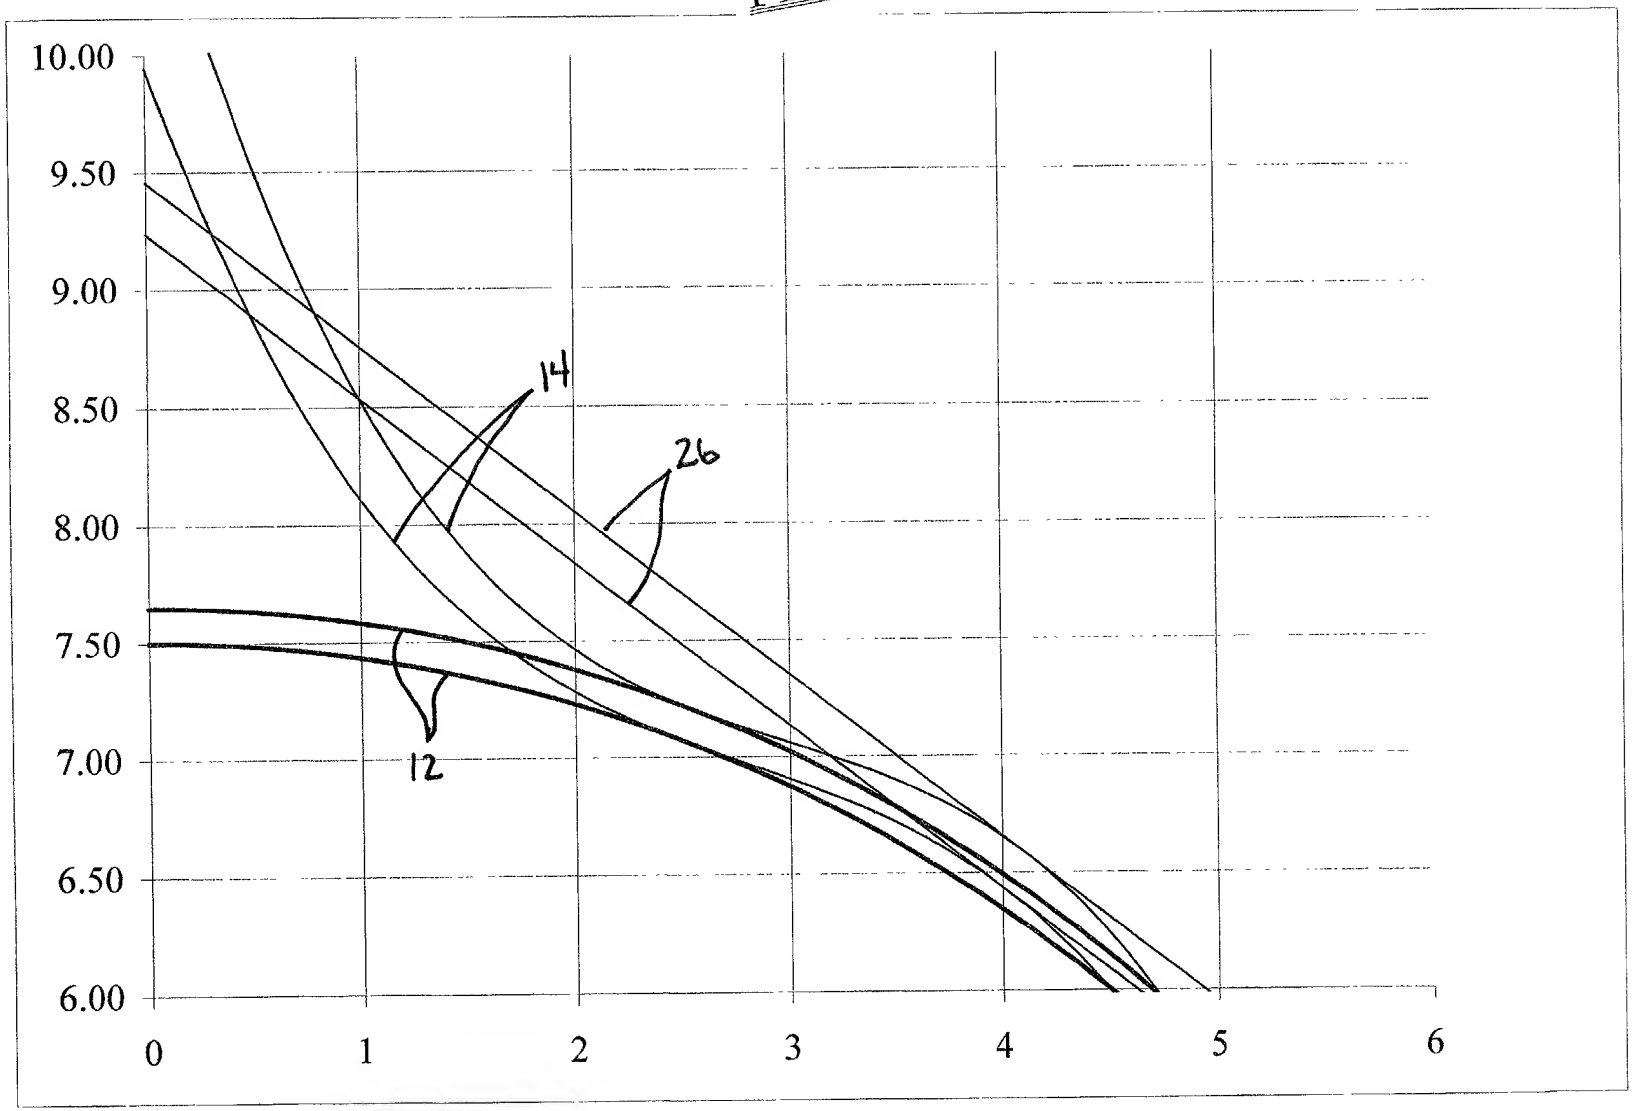

FIG. - 40

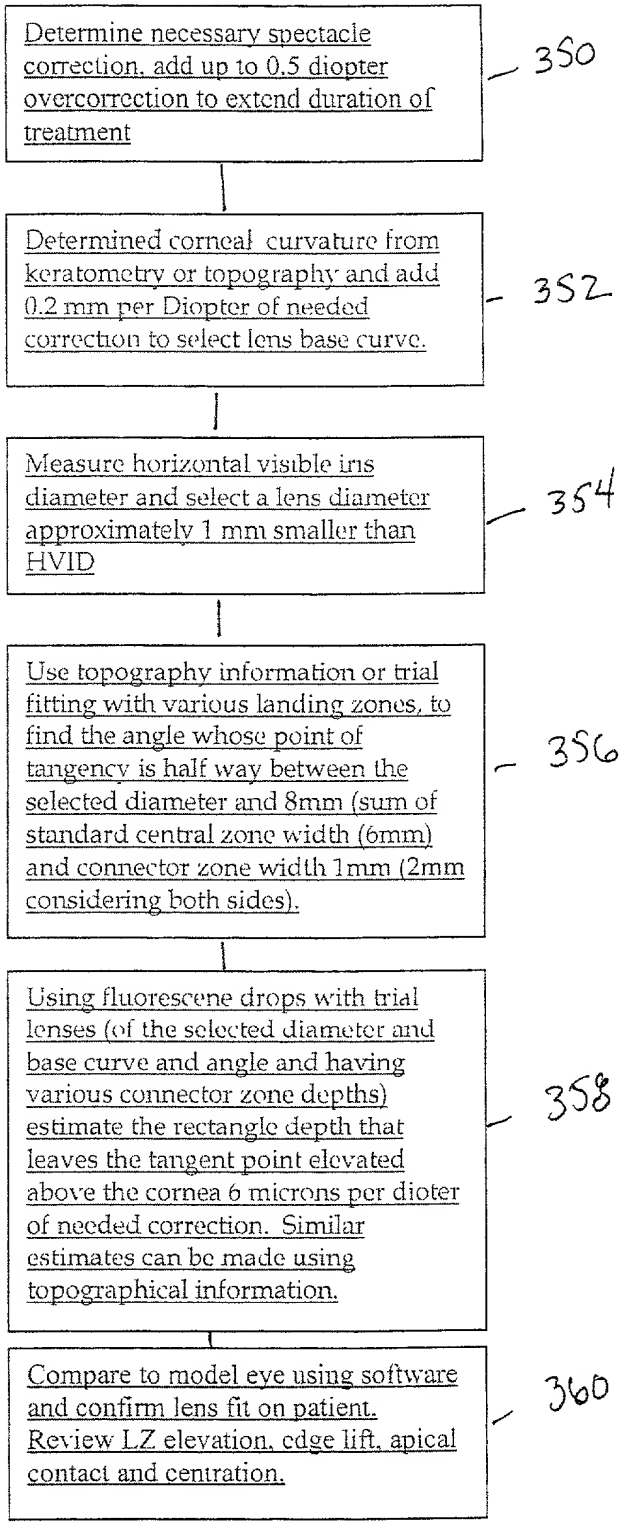

Determine necessary spectacle correction, add up to 0.5 diopter overcorrection to extend duration of treatment
350
Determined corneal curvature from keratometry or topography and add 0.2 mm per Diopter of needed correction to select lens base curve.
352
Measure horizontal visible iris diameter and select a lens diameter approximately 1 mm smaller than HVID
354
Use topography information or trial fitting with various landing zones, to find the angle whose point of tangency is half way between the selected diameter and 8mm (sum of standard central zone width (6mm) and connector zone width 1mm (2mm considering both sides).
356
Using fluorescene drops with trial lenses (of the selected diameter and base curve and angle and having various connector zone depths) estimate the rectangle depth that leaves the tangent point elevated above the cornea 6 microns per dioter of needed correction. Similar estimates can be made using topographical information.
358
Compare to model eye using software and confirm lens fit on patient. Review LZ elevation, edge lift, apical contact and centration.
